

## DATABASE DESIGN ASSESSMENT

For this assessment we will be looking at a database for a video game store that sells video games for multiple consoles either brand new or used. This database will support the following:

- For each Company in the database, we should be able to see:
  - The company names
  - A list of consoles from that company
  - The original release date of the console
- For each console we should be able to find out:
  - The name of the console
  - The price of the console
  - Whether the console is new or used
  - The list of game publishers for this console
  - The quantity in store
- For each publisher
  - We should have the company name
  - We should have a list of games they've published
- For each game we should find out:
  - The price of the game
  - The title of the game
  - Whether it is new or used

Marco Bucciachio

Brand (Sony, Microsoft, Nintendo)

- Name
- ConsoleName
- ReleaseDate

Console (playstation, xbox, switch)

- Name
- Price
- Status
- Quantity
- Publisher

publisher

- Name
- GameTitle
